

FlexTT5-Nikon

The FlexTT5's simple design comes to life through its hot-shoe connection with a camera or flash.

On camera, the FlexTT5 works identically to the MiniTT1 with the convenience of AA batteries. The system tracks your changes in ISO and aperture and reacts accordingly to make sure exposures stay right on target. Use the exposure compensation dial on your camera to remotely adjust your flash output. Mount a flash or command unit on the FlexTT5 to use the same zone controls as you would normally. Slip in the AC3 ZoneController for Nikon and use its simple interface to control three zones of lights.
